Refractive Lens Exchange (RLE)

Refractive Lens Exchange, also called lens replacement surgery, may be a better option than LASIK for people with presbyopia. Refractive Lens Exchange (RLE) replaces your eye's clear natural lens with an artificial intraocular lens to correct your refractive error and achieve sharper focus, reducing or eliminating your need for reading glasses or bifocals.

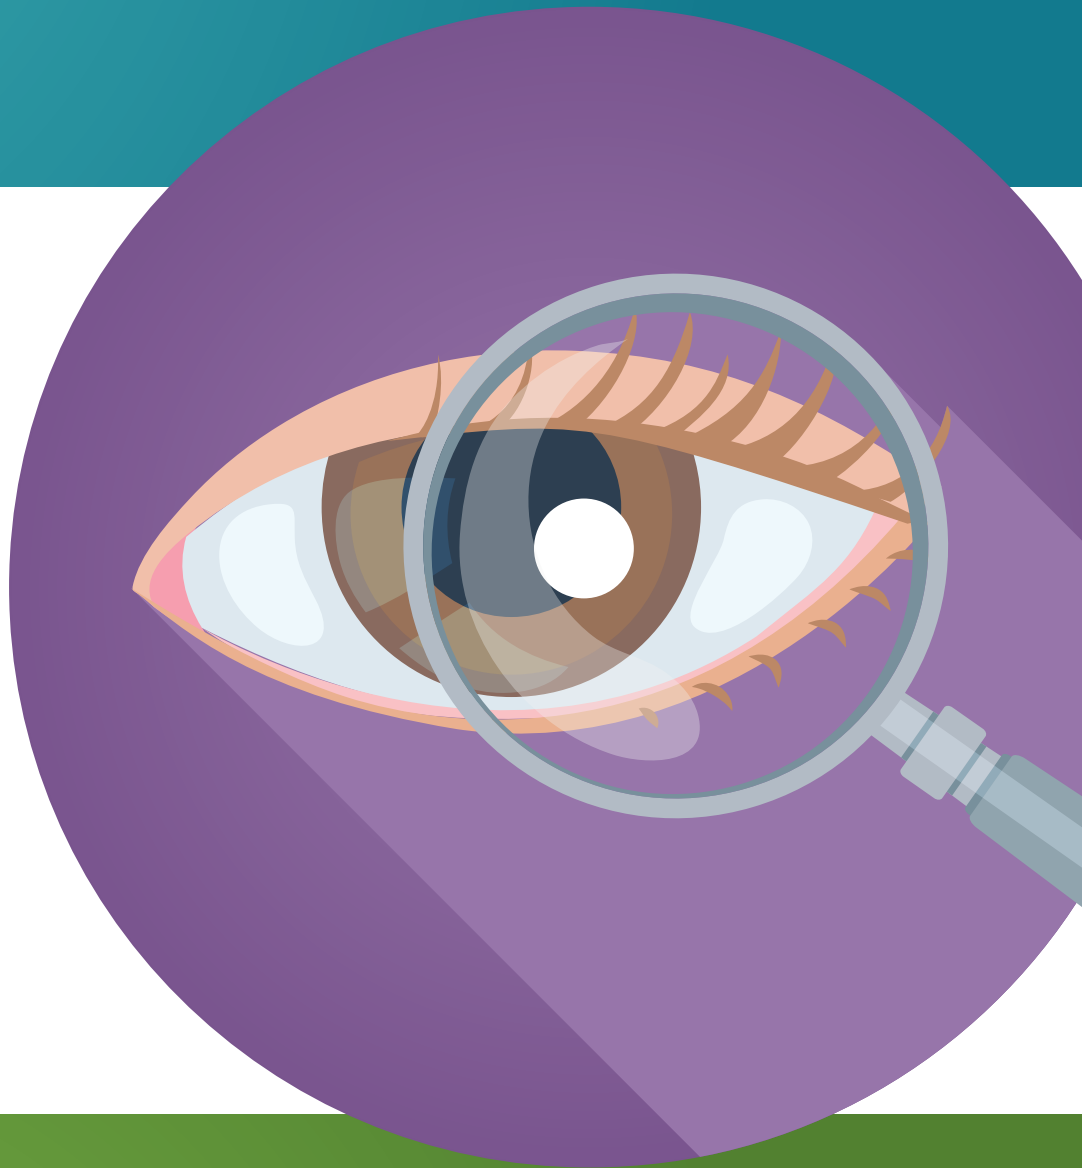

Difficulty Seeing Your Phone?

Having a hard time reading your phone or that restaurant menu? RLE gets 40+ year old patients out of those reading glasses for many every day tasks.

Dysfunctional Lens Syndrome

Decreased functional vision related to the effects of increasing optical aberrations, as well as subtle age-related opacification and hardening of the lens.

100%

of the population experiences Dysfunctional Lens Syndrome sometime in their 40's and it continues to worsen with age.

Most Common Ocular Surgery

Lens replacement surgery is the most common procedure done today, and Eye LASIK Austin is Austin's leader.

20/20

The Near Vision Solution

RLE can correct astigmatism, distance and near vision with the many lens options available today.

Quick & Easy Procedure

Typical routine - Prep with surgeon for measurements, your eyes treated a few days apart, then a quick recovery.
